Version 1 with Racing caps base Made in Italy

2.5.0.0

Pre-preg Carbon Fiber parts use less resin because it is "cooked" under pressure in an autoclave which results in a stronger and lighter product than typical wet-lay up Carbon Fiber because it eliminates excess resin. The autoclave process eliminates

voids, pushes out excess resin and creates a denser more uniform product that is lighter, stronger and more flexible. Pre-preg is the preferred method for racing, and aerospace. It is more expensive to build with this method but it results in a superior product.
